Job requirements

We will be receiving this CSV file for all of our tenants. The table schema definition is the same across all files, but the contents differ.

First requirements: Grouping Sales data by Country, and Category.

It returns the total number of orders and the total purchase price for each group.

If a specific country is provided, the process should filter the data for that country. Otherwise, it returns data for all countries.

The results are ordered by Country in ascending order and Total Purchase Price in descending order.

Second requirements: Get Bicycle Sale Details

Groups the sales data by country, category, and color, and counts the quantity of each color.

Questions

CAN THE GENERATIVE AI ASSIST
YOU WITH THESE TASKS?

IF YES, WHAT WOULD BE YOUR
STRATEGY TO ACCOMPLISH THIS
TASK?

WHAT WOULD BE THE
CONSIDERATIONS FOR
IMPLEMENTING THIS STRATEGY?

Thank You!
